

Abstract of the Invention

A method produces an anti-tumor response in a mammalian subject in need of anti-tumor treatment. Hybrids of tumor  
5 cells with dendritic cells or dendritic-like cells can be administered to the subject. The tumor cell of the hybrid corresponds to the tumor of the subject. Alternatively, autologous immune cells of the subject can be administered in which the immune cells are activated *in vitro* by co-  
10 cultivation with these hybrids.
